

*Salient Features*

Core network estimate (shown): 70,000 km

Regional Fiber Spurs (to reach other major areas not in yellow and to connect Wireless Hubs): 30,000 km

~ 400 population centers are connected, including all capitals and larger cities.

The links shown are largely along major roads, which thus cover many population centers. Preliminary GIS modeling indicates good penetration of this fiber/wireless hybrid design.

Fiber (including laying) is roughly half the capital costs – implies most expenditure can have a long amortization horizon.
